nſter-row*. M.DCC.XXIX.

AN ACCOUNT OF THE SUCCESS OF

Inoculating the SMALL-POX in Great
Britain, for the Years 1727 and 1728.

WITH

A Comparison between the Mortality of the
Natural Small-Pox, and the Milder Sorts in
that Practice; as also some general Remarks
on its Progress and Success, since its first In-
roduction.

To which are added,

I. An Account of the Success of Inoculation in
Foreign Parts.

II. A Relation of the like Method of giving the
SMALL-POX, as it is practised in the Kingdoms of
Tunis, Tripoli, and Algiers. Written in Arabic by
his Excellency CASSEM AGA, Ambassador from
Tripoli. Done into English from the French of
M. DABIGNY, his Majesty's Interpreter for the
Eastern Languages.

By JOHN GASPHER SCHNEUBACHER, M.D.

F.R.S. and of the College of Physicians.

mall. MDCCLXXIX.

terrible Dissemper; and consequently whe-
ther it deserves to be encouraged, as lau-
dable, useful, and salutary: or whether it
~~ought to be rejected as pernicious of un-~~
~~certain Consequences, and attended with ill Con-~~
sequences.

Nothing certainly can be more condu-
cive to this end, than from time to time to
An Account of the Success of
Inoculating the SMALL
POX, &c.

THE following Undertaking, I pre-
sume, will need no Apology. It is
allowed on all hands, and indeed
the many and deplorable Instances of the
Severity of the Small-Pox, we daily meet
with, too evidently convince us, that it is a
Point of very great Importance to Mankind,
by a continued and impartial Enquiry to de-
termine, whether or no the Practice of In-
oculation, which was some Years since in-
troduced in this Country, appears by Expe-
rience in any wise beneficial to save the Lives
of some out of those many, who would
otherwise, in the Course of Things, in all
human Probability, fall a Sacrifice to this
drop

terrible Distemper; and consequently whether it deserves to be encouraged, as laudable, useful, and salutary: or whether it ought to be rejected, as hazardous, of uncertain Success, and attended with ill Consequences.

Nothing certainly can be more conducive to this end, than from time to time to lay before the World such well-attested Matters of Fact, as may enable every one, by natural, easy, and unavoidable Consequences drawn from them, for himself to form a Comparison between the Mortality of this Distemper in the natural Way, and the Success, whether good or bad, that attends the Practice of Inoculation. This hath been done for some Years past with that Candour and Impartiality by the learned Dr. *Jurin*, as deservedly merited the favourable Reception; his annual Accounts of the Success of this Practice have met with; and I should have thought it an unpardonable Presumption to take it out of such able Hands, if he had not both in publick and private declared his Resolution not to go on with them any longer. As for myself, 'twas not till some time after, and when nobody else seem'd disposed to engage in it, that I determin'd to take the Pains upon me, rather than suffer it to be altogether dropt.

dropt. If my Endeavours should prove in any wise serviceable to the Publick, as I had great reason to believe they would be agreeable to some of my particular Friends, I shall think my Labour sufficiently well bestowed.

It was a very great Encouragement to me, that when I acquainted the Royal Society with my Intention, they were pleased to approve of it, and at my Request to grant me the Liberry of perusing and extracting such Papers relating to this Practice, as were or should be transmitted to them, especially those that had been deposited with them by Dr. Jurin, an Extract whereof he had not yet inserted into his annual Accounts. Neither can I in justice to this Gentleman forbear in this publick manner, to return my grateful Acknowledgments for his kind Communication of such other Accounts, as he receiv'd since that time, and I do not in the least doubt of the Continuance of his favourable Assistance for the future.

What I am now going to offer to the Publick is an Account of the Success of the Practice of Inoculation for the Years 1727 and 1728, and I purpose, God willing, to continue the same from Year to Year.

Year: promising myself, From the Usefulness and Importance of this Design, that all Persons concerned in this Practice will readily oblige me with their Observations on its Success, whether good or bad. On my part, I can only vouch for the Sincerity of my Intention, and that I shall make it my constant Endeavour, free from any private Views, to act the Part of an Historian, and with all possible Faithfulness and Impartiality to represent Facts, as upon Inquiry I shall find they are. I am very sensible, that it will be extremely difficult for me to content two opposite Parties, which have hitherto appeared, not without a good deal of Zeal and Warmth, one for, the other against Inoculation: and that, whilst the Favourers of this Practice will perhaps find room to complain of my representing its Hazard much greater than it really is, by inserting into the List of those suspected to have died by Inoculation, Persons whose Death they will pretend was owing to other Causes, the Anti-Inoculators will nevertheless think me partial, if even after granting every thing they can reasonably pretend to, the Odds should still appear in favour of the Practice. My Security and Satisfaction shall be in a strict Regard to Truth, and as I shall confine myself only to Matter of Fact, and such plain and easy Deductions, as must necessarily

farily follow from thence, so in case of any Doubt arising, I shall be ready upon all Occasions to produce my Vouchers for what I advance. I shall think no trouble too great to come at the true State of Things, but if after all I should happen to be misinformed in any particular Case, I shall be very thankful to any, that will please to set me right, and will not fail in my next candidly to acknowledge and correct the Mistakes. But I hope I shall be easily excused from entering into any other Controversies on this Subject, both as I can employ my time much better, and as in the end all Reasoning, however specious and plausible, will never be thought sufficient to overbalance the plain and convincing Evidence of Matter of Fact.

The Fate of Inoculation hath been very judiciously stated by Dr. Jurin, principally to depend upon the Decision of the two following Questions.

1. Whether the Distemper given by Inoculation be an effectual Security to the Patient against his having the Small-Pox in the natural Way?

2. Whether the Hazard of Inoculation be considerably less than that of the natural Small-Pox?

B

Should

Should either of these two Questions once come to be fairly determined in the negative, the Practice of Inoculation, I believe, would be no longer supported. For it cannot be presumed, that any one would run the Hazard of Inoculation, unless he may depend upon its effectually securing him from having the Small-Pox in the natural Way; the rather as there is some Chance, tho' perhaps not very considerable, for his not having the Distemper at all. Nor can it be supposed, in case the Hazard of Inoculation should be found by Experience equal to that of the natural Small-Pox, I will not say greater, that any one would be either so far bereaved of his Senses, as to advise the Operation, or that he would find People venturesome enough to undergo it. But if on the other hand, those Persons, who have had the Small-Pox given them by Inoculation, should appear by Experience to be thereby effectually secured against undergoing that Distemper a second time in the natural Way; and if the Hazard of the inoculated Small-Pox comes out less than that of the natural one, I believe every prudent and thinking Person, that hath the Good of his Country, and the Preservation of his Relations and Friends at heart, will look upon Inoculation as a Practice beneficial to

Mankind, and which therefore ought to be encouraged.

As to the first of these two Questions, Dr. *Jurin*, in his annual Accounts of the Success of Inoculation, particularly that for the Year 1725, hath, I think, sufficiently shewn, both from Reason and Experience, that the affirmative Side is highly probable, and withal how very little Credit he found, upon Enquiry, was to be given to several Stories, that were very confidently reported abroad, of Persons who had the Small-Pox by Inoculation, but afterwards underwent the Distemper a second time in the natural Way. Neither could I hear of any one single Instance to the contrary, that offered in the Course of the two last Years; so that, for ought it hitherto appears, by about eight Years Experience, Inoculation proves an effectual Security against the natural Small-Pox, and even those that had but an imperfect sort of Small-Pox by Inoculation, seem to be equally safe from that Distemper in the natural Way. There have been indeed some Instances, where Inoculation had no manner of effect on the Persons inoculated; and some of these have been afterwards seized with the natural Small-Pox: neither is there any ground to suspect, that where the Operation doth not produce its

intended Effect, the Person should be notwithstanding secured by it against the Distemper, no more than in any other contagious Disease. Persons exposed to the Danger of Infection, because they escape it once, twice, or oftner, could in Reason and Prudence look upon themselves as safe from any future Attack. Among those, on whom this Operation was performed the two last Years, it may not be amiss to take notice of one Person, who I find was inoculated twice; the first time the Operation had no Effect, the second time it produced an imperfect Small-Pox. What follows is an Account of this Case, as contained in a Letter to Dr. Jurin from Mr. Lake Junior, Surgeon at Sevenoak in Kent, of Mr. Charles Freeman, aged twenty five, was inoculated at Sevenoak in Kent, (by Mr. George Lake Senior, who is since dead.) He had no Symptoms of the Distemper at the usual time after Inoculation. Mr. Lake having reason to suspect that he had been exposed upon by the Person who lent him the Matter, applied about a Fortnight from the first, some fresh Matter (which he had taken himself, and with which he had inoculated his Apprentice) to the same Incisions. This produced all the Symptoms of the Small-Pox about nine Days after, when several small Eruptions

“appeared, which tho’ they never filled
 “and suppurated, like the rest he had in-
 “oculated, were judged to be the real Small-
 “Pox.”

I go on therefore to what I have to offer
 from the two last Years Experience towards
 determining the second of the two Ques-
 tions proposed; viz. Whether the Hazard
 of Inoculation be considerably less than that
 of the natural Small-Pox.

And first as to the Hazard of the natural
 Small-Pox, it appears by Dr. Jurin's former
 Accounts, that

	Sick of the Small-Pox.	Died.
out of	18229	2957
At Uxbridge, and in the		
Neighbourhood, the		
Small-Pox having		
been exceedingly fa-		
tal all thereabouts,		
communicated by Dr.		
Thorold.	140	51

Total	18229	3008
-------	-------	------

So that out of 18229 Persons of all Ages,
 who had the Small-Pox in the natural Way,
 in different Years, and at all Seasons, there
 died 3008, that is, one in six, which, con-
 sidering

Considering the Largeness of the Numbers, we may well lay down for the Hazard of the natural Small-Pox.

The Account of Inoculation for the Years 1727 and 1728 is as follows.

Inoculated in and about London.

By *Claudius Amyand Esq;* Sergeant-Surgeon to his Majesty in 1727

In 1728

By *Mr. Alexander Small* Surgeon, in 1726

In 1727

In 1728

By *Mr. Maitland* Surgeon, in 1727

By *Mr. Robert Talbot* Surgeon, (under the Direction of the late *Dr. Friend*)

in 1727

By *Mr. Robert Baker* Surgeon, in 1727

In 1728, (three of these were inoculated under the Care of *Dr. Jurin*)

By *Mr. John Wemyes* Surgeon, in 1727

8008

18220

I am now to give an Account of the Cases of the three Persons suspected to have died by Inoculation.

"I. A Son of Mr. *Wansley*'s at *Warminster*, aged a Year and a half, was inoculated *December 1. 1727*. He had the Distemper very favourably, not

C

"above

“ above forty Pustules in his Face and
 “ Neck, and few or none in his Body.
 “ His Incisions run well, the Pustules
 “ came to full Maturity the seventeenth
 “ or eighteenth Day from the Inocula-
 “ tion. The Child being for some time
 “ perfectly well, died in nine or ten
 “ Days after.” *Mr. James Elderton, in*
his Letter to Dr. Jurin, dated at Sarum,
Jan. 18. 172 $\frac{2}{3}$.

— “ *H. Enoch Trumble*, aged eight Months,
 “ was inoculated at *Newbegin*, three
 “ Miles from *Newcastle*, in *February* 16.
 “ 172 $\frac{7}{8}$, with one small Incision in the
 “ Arm, at a time when the Small-Pox
 “ were frequent and fatal in that Part
 “ of the Country. On the eighth Day
 “ after Inoculation he first began to be
 “ a little disordered. On the ninth Day
 “ I observed three or four crySTALLINE
 “ Eruptions about the Toes, which with
 “ several more that afterwards appeared
 “ on the Feet and Legs, (some of
 “ which increased in the Progress of the
 “ Distemper to at least treble the Big-
 “ ness of the ordinary Pustules in the
 “ large distinct sort of Small-Pox) when
 “ opened contained a limpid inodorous
 “ Water. On the tenth Day in the E-
 “ vening

“ vening he had a slight Convulsion-
 “ Fit, and on the eleventh early in the
 “ Morning, several Pustules appeared of
 “ the distinct sort of a very good Co-
 “ lour, and the Fever, Restlessness, and
 “ other Symptoms, very much abated.
 “ At Night the Child was seized with a
 “ cold Fit and Fever succeeding it, and
 “ from that time the Pustules lost their
 “ beautiful red Colour, and most of them
 “ never fill’d kindly, but appeared flat
 “ and dimpled. I ought to observe,
 “ that a few Days after the Operation,
 “ the Mother, who was also Nurse to
 “ the Child, was seized with the Return
 “ of an Ague, which both she and the
 “ Child were afflicted with about two
 “ Months before. From this Conjun-
 “ tion of the variolous Fever and Ague,
 “ as I took it to be, a new Disease
 “ seemed to be formed with contra-indi-
 “ cating Symptoms: While Nature with
 “ her joint Force was endeavouring to
 “ expel the variolous Matter to the Sur-
 “ face, an half an Hour’s Fit of a chill
 “ Ague would confound the whole De-
 “ sign. This was the State of the Case
 “ in the Beginning, but after a few Days
 “ I conceived considerable Hopes from a
 “ happy Metastasis, and consequent up-

" on that an Abatement of all the hete-
 " roclite Symptoms, that must neces-
 " sarily proceed from so confused a Case.
 " For on the fifteenth Day on one of
 " the Arms, on the sixteenth Day on
 " the other, and about two Days after
 " on the great Toes, immediately un-
 " der the common Integuments, white
 " Swellings appeared, not inflamed, red,
 " or tense, and very little sore, but
 " seemed to be barely a Translation of
 " the purulent Matter denied Entrance
 " to the Surface, and being opened a-
 " bout two or three Days after their first
 " Appearance, they discharged a matu-
 " rated Pus, like that in the ripe Pu-
 " stules, from the Elbows each about
 " half a Spoonful. By the Help of this
 " Discharge Matters proceeded tolerably
 " well, and I began scarce to doubt of
 " the Child's Recovery; for by this time
 " the Pustules, tho' indeed never well
 " filled, were arrived to a State of Ma-
 " turation, and seemed to form laudable
 " Pus, and on the eighteenth and nine-
 " teenth they began to incrustate, espe-
 " cially on the Face and Legs, and soon
 " after to scale off. I ordered a proper
 " Purgative to be administred, and I think
 " repeated, and left the Child in a re-
 " covering

“ covering Way. Somewhat less than
 “ a Fortnight after I was sent for in
 “ great haste, but found the Child was
 “ dead before I got there. I could on-
 “ ly learn that he had two or three
 “ Returns of an irregular Fever, attended
 “ with great Restlessness, which ’tis pro-
 “ bable was the intermitting Fever that
 “ I said I did believe was complicated
 “ with the Small-Pox, and remained af-
 “ ter it.” *Dr. Tim. Bennet, in a Let-
 ter to me, dated at Yarmouth, March 12.
 172¹/₂.*

III. The Son of a Person of Quality,
 (whose Name I am desired to conceal)
 eleven Years old, was inoculated in *Lon-
 don* at the beginning of *April, 1728*. He
 sicken’d on the sixth Day from the Ope-
 ration, and but few Pustules appeared
 between the eighth and ninth. He died,
 as I am informed, in about fifteen Days
 from Inoculation. As I have not my-
 self obtained any farther Particulars re-
 lating to the young Gentleman’s Case,
 I hope the Reader will pardon my being
 so short.

By *Dr. Jurin’s* former Accounts the
 whole Number of Persons, who had then

had the Small-Pox by Inoculation, was seven hundred and twenty four, fourteen of which had been suspected to have died of Inoculation; and the two last Years we have three suspected to have died out of an hundred and twenty one, that is in all seventeen out of eight hundred and forty five, or nearly one in fifty. Whether or no the first of these three can be fairly said to have died of Inoculation, and how far the intermitting Disorder of *Enoch Trumble*, as well as that of his Mother, whom he continued to suck during the Course of the Distemper, might have been instrumental in occasioning the Death of the Child, is submitted to the Judgment of every impartial Reader. If we deduct one, as I believe the Favourers of Inoculation will think it reasonable we should, inasmuch as even the greatest Advocates of this Practice never pretended to recommend it as a Security against other Distempers and Accidents, the Hazard of Inoculation will be that of sixteen out of eight hundred and forty five, or one in fifty two. If both be deducted, it will be that of eight hundred and forty five, or one in fifty six.

Thus

Thus far, what I had to offer from the two last Years Experience towards determining the second of the two Questions proposed, *viz.* Whether the Hazard of Inoculation be considerably less than that of the natural Small-Pox. To clear up this Matter still farther, I have thought it would not be improper to lay before my Readers at one View, which I have done in the following Table, the Progress and Success of this Practice in *Great-Britain*, from the Year 1721, when the first Experiments were made on some of the Malefactors, then under Sentence of Death in *Newgate*, to the End of the Year 1728, and to subjoin some Remarks, tending either to enforce, or farther to illustrate the Observations formerly made by Dr. *Jurin*.

Year		Persons inoculated		Persons who died		Persons who recovered	
1721	1	1	0	0	1	1	1
1722	1	1	0	0	1	1	1
1723	1	1	0	0	1	1	1
1724	1	1	0	0	1	1	1
1725	1	1	0	0	1	1	1
1726	1	1	0	0	1	1	1
1727	1	1	0	0	1	1	1
1728	1	1	0	0	1	1	1
Total		7	0	0	7	7	7

Table continued from the Table

That out of eight hundred and nine

ty seven Persons of both Sexes and all

ages that were inoculated in Great

Britain in the Course of eight

years

A Table containing the several Ages of the Persons inoculated in Great-Britain, from the Year 1721, to the End of the Year 1728; together with the Success of the Operation, in the same manner with those published before.

Age.	Persons inoculated.	Had the Small Pox by Inoculation.	Had an imperfect Small Pox.	No Effect.	Supposed to have died.
Under 1 Year.	24	24	00	00	2
1 Year to 2	34	33	00	01	4
2 to 3	65	65	00	00	1

4 to 5	65	63	00	02	1
5 to 10	257	249	03	05	3
10 to 15	140	131	01	08	1
15 to 20	104	95	03	06	2
20 &c.	110	91	06	13	2
Age unknown.	7	6	00	01	0
Total	897	845	13	39	17

Now it appears from this Table,

That out of eight hundred and ninety seven Persons of both Sexes and all Ages, that were inoculated in *Great-Britain*, in the Course of eight Years, eight

eight hundred and forty five had the true Small-Pox by Inoculation, to which if we add thirteen, who had an imperfect Small-Pox, the whole Number of Persons, upon whom the Operation produced some Effect, will be eight hundred and fifty eight.

That in young Children the Operation more constantly produced its intended Effect, than in Persons of more advanced Years, there being none under five Years of Age, who did not receive the true Small-Pox by Inoculation, and but three from five Years to ten; four from ten to twenty; and six from twenty and upwards, who had an imperfect fort.

That it had no Effect upon thirty nine out of eight hundred and ninety seven, most of whom 'tis probable had had the Small-Pox before, which was known to be the Case of some, who were inoculated only for Experiment's sake, and was doubtful with regard to many of the rest.

That among those, upon whom the Operation had no Effect, there are many

D

more

more grown Persons in Proportion, than young Children, the Probability of their having undergone the Distemper in the natural Way increasing, as they advance in Years. Thus there is but one out of thirty nine under two Years of Age, ten from two to ten Years, and fourteen from ten to twenty, upon whom Inoculation produced no Effect. The remaining thirteen were all above twenty, and the Age of one is unknown.

That on the other hand, contrary to what is observed in the Course of the natural Small-Pox, the Hazard of Inoculation is greater to young Children than grown Persons, since among those suspected to have died of it, there are

6	57	25	19	Under 2 Years
3	216	1	72	Between 2 & 5
3	249	1	83	From 5 to 10
3	226	1	75	From 10 to 20
2	91	1	45	Upwards of 20

Six whose Age was not known, are not included in this Table.

That the utmost Hazard of Inoculation that can be pretended to by the Opposers

posers of this Practice, is that of seventeen out of eight hundred and forty five, or eight hundred and fifty eight, that is, one in fifty. These were at least all that came to the Knowledge either of Dr. *Jarin*, or myself; though 'tis highly probable, that had there been any more whose Death could in any wise be look'd upon as the Effect of Inoculation, they would not have fail'd being talk'd of; as on the other hand there is a great deal of reason to think, considering the Difficulty of collecting these Accounts, and the particular Humours of some People, that a good many are omitted for Want of Information, who went favourably through the Operation.

That all Allowances made, the Odds remain as much in favour of this Practice, as the Hazard of the natural Small-Pox, (which by the Calculations above, appears to be that of one in six) exceeds the Hazard of Inoculation, which at the utmost is no more than that of one in fifty.

What I have hitherto advanced, is the bare Result of the Calculations and Tables above; and although upon the whole

the Estimate comes out in favour of the Practice, yet I am sensible the Inoculators will think it is still stated too much to its Disadvantage. They will urge from the respective Cases of those seventeen out of eight hundred and forty five, or eight hundred and fifty eight, that were suspected to have died of Inoculation, as they are set forth in Dr. Jurin's former, and this present Account, that far from allowing Inoculation to have been the Cause of all their Deaths, considerable Deductions ought to be made, for the following Reasons.

- That the seventh and fourteenth * Case ought to be left out of the Computation, because those two Persons had not in Fact received the Small-Pox by Inocu-

* For the better understanding of these Remarks, the Reader is desired to have recourse to Dr. Jurin's former Accounts of the Success of this Practice, where he will find the first nine Cases in his Account of the Success of Inoculation to the End of the Year 1723, the tenth in his Account for 1724, the eleventh, twelfth, and thirteenth in that for 1725, and the fourteenth in that for 1726. The fifteenth, sixteenth, and seventeenth, are inserted in this present Account. (Vid. App. No 1.)

lation, their Death, though indeed subsequent to it, having been apparently owing to other Causes; in one to a nervous Fever, which carried him off near three Months after the Operation; in the other to a *Hydrocephalus*; and this latter died on the eighth Day from the Incisions, before any Appearance of an Eruption.

That the tenth ought to be struck off from the List; the great Irregularities and Excesses in Drinking, even after he underwent the Operation, having been very evidently the Cause of his Death.

That the twelfth ought not to be taken in, because the Patient died of a malignant Fever, sixteen Days from the Eruption, when the Small-Pox was dry, and scaling off,

That the same Case, as also the eighth, should be left out of the Comparison, because even if it should be allowed, that they died of the Small-Pox, yet there is a great deal of reason to suspect, that they had received the Infection before in the natural Way, the Eruption appearing
some

some Days sooner, than is usual in the inoculated Small-Pox.

That several of those Persons, who are suspected to have died of Inoculation, having been either of a very sickly Constitution, or actually labouring under Diseases, though perhaps not perceived by the Inoculator, or concealed from him by their Parents; their Death cannot in justice be brought in to increase the Hazard of Inoculation, which should be performed with all proper Caution, and upon Persons of a healthy Constitution; and that on this account the fourth, sixth, eighth, and sixteenth Case ought to be left out of the List.

That all those also should be left out of the Question, who did not die in the Course of the Distemper, but by subsequent Disorders or Accidents, and after the Small-Pox was gone off; since neither in the Bills of Mortality they are brought in under the Article of the Small-Pox, but under the respective Diseases they happen afterwards to die of; and that on this single Account there may be room to strike off the first, second, fourth, fifth,

fifth, seventh, ninth, twelfth, thirteenth,
and fifteenth.

That all these Deductions being made, there remain but three out of eight hundred and forty five, or eight hundred and fifty eight, that is, one in two hundred and eighty one or two hundred and eighty six, that can be said to have died of Inoculation; and that perhaps even the third and eleventh Cases might be disputed from the Circumstances; and the seventeenth for want of a more particular Information.

How far the several Objections that have been, or may be brought by the Inoculators against the Estimate above, may be of Weight in reducing the Hazard of Inoculation below what it is here represented to be, every impartial Reader is left at Liberty to judge; and may upon perusal of the respective Cases of those Persons, that were suspected to have died of Inoculation, strike off as many as he thinks proper. If he sees Cause to deduct one out of seventeen, the Hazard will be that of one in fifty three or fifty four.

If

If he except

The Hazard will be

two	56	57
three	68	61
four	65	66
five	70	71
six	77	78
seven	84	86
eight	94	95
nine	105	107
ten	121	123
eleven	141	143
twelve	169	171
thirteen	211	214
fourteen	281	286

I purposely avoid entering into any Reasons and Speculations, either in behalf or against this Practice, any otherwise than as they naturally follow from Matter of Fact: but before I conclude, I will beg leave to add the following Comparison between the Mortality of the natural Small-Pox, and the State of Inoculation for eight Years last past, being the whole time this Practice has been carried on in this Country.

A Table, shewing the Mortality of the Natural Small-Pox, from the Year 1721 to 1728 inclusive, compared with the State and Hazard of Inoculation during that time.

Year.	Natural Small-Pox.				Inoculated Small-Pox.		
	Total Number of Burials.	Died of the Small-Pox. In all.	In 1000.	In Proportion.	Number of Persons inoculated.	Had the Small-Pox by Inoculation.	Supposed to have died of Inoculation.
1721	26142	2375	91	$\frac{1}{12}$	} 483	449	9
1722	25750	2167	84	$\frac{1}{12}$			
1723	29197	3271	112	$\frac{1}{9}$			
1724	25952	1227	47	$\frac{1}{21}$	46	42	1
1725	25523	3188	125	$\frac{1}{8}$	152	144	3
1726	29647	1569	53	$\frac{1}{19}$	107	102	1
1727	28413	2379	84	$\frac{1}{12}$	} 109	106	3
1728	27810	2105	76	$\frac{1}{12}$			
Total	218439	18281	83	$\frac{1}{12}$	897	845	17
At a Medium.	27305	2285	83	$\frac{1}{12}$			

From this Table it appears,

That in the Course of eight Years last past, there died of the Small-Pox every Year at a Medium two thousand two hundred and eighty five Persons out of twenty seven thousand three hundred

E

and

and five, or a twelfth part of the total Number of Burials.

That the greatest proportional Mortality was in the Year 1725, when this single Distemper carried off three thousand one hundred and eighty eight out of twenty five thousand five hundred and twenty three, or one eighth of the total Number of Burials. For although in the Year 1723 we have had three thousand two hundred and seventy one dead of the Small-Pox, yet in proportion to the total Number of Burials, which was then twenty nine thousand one hundred and ninety seven, it is but one ninth. The Mortality of this Distemper was exactly the same in proportion, I mean one eighth of the total Number of Burials, in the Year 1681, when it carried off two thousand nine hundred and eighty two, out of twenty three thousand nine hundred and seventy one, or an hundred and twenty five out of every thousand: and again in the Year 1710, when there died of the Small-Pox three thousand one hundred and thirty eight out of twenty four thousand six hundred and twenty, or an hundred and twenty seven out of every thousand.

And

And it is remarkable, that these three Years were preceded by three very favourable ones ; but six hundred and eighty nine out of twenty one thousand and fifty three (that is one in thirty one of the total Number of Burials, or thirty three out of every thousand) having died of the Small-Pox in the Year 1680, and but one in twenty one in 1709, or a thousand and twenty four out of twenty one thousand eight hundred, which gives forty seven for each thousand, being exactly the same in proportion with 1724, when one thousand two hundred and twenty seven died out of twenty five thousand nine hundred and fifty two ; that is again one in twenty one of the Number total, or forty seven out of each thousand.

That in the Year 1725, when the Mortality of the natural Small-Pox was so very considerable, the Practice of Inoculation proved notwithstanding very favourable, but three being suspected to have died out of an hundred and forty four, or one in 48.

If for Argument's sake we suppose, that the two thousand two hundred

and eighty five, who died yearly of the Small-Pox, at a medium, for eight Years last past, had been inoculated, and allowing the Hazard of Inoculation to be, what it proves at the utmost, that of one in fifty, there would have died out of this Number only forty five or forty six; so that two thousand two hundred and forty Lives might have been saved annually.

But as it may be objected against this Estimate, that we ought not to form any Comparison merely and independently from the Number of those, who were carried off by the Small-Pox, but that we ought to consider the Matter with regard to the Number total of Persons of all Ages and Constitutions, who must have been sick of this Distemper to occasion such a Mortality; let us see what the Case would have been then. The Hazard of the natural Small-Pox appears by the Calculations above to be that of one in six, and two thousand two hundred and eighty five Persons having died of it yearly at a medium, it follows that thirteen thousand seven hundred and ten must have been sick of the Distemper at a medium every Year. Now sup-
 posing

posing the Practice of Inoculation to have been universally prevalent, and allowing its Hazard to be as that of ten to fifty, there would have died out of that Number two hundred and fifty four or two hundred and fifty five, instead of two thousand two hundred and eighty five, and consequently at least two thousand Lives would have been saved annually out of two thousand two hundred and eighty five, and sixteen thousand and upwards, out of eighteen thousand two hundred and eighty one, who actually perished by this Distemper only, in the Course of eight Years.

If on the contrary the eight hundred and forty five who received the Small-Pox by Inoculation had been infected in the natural Way, an hundred and thirty or an hundred and thirty one would have been lost out of that Number, instead of seventeen: so that Inoculation may be reckoned to have actually saved an hundred and thirteen or an hundred and fourteen Lives, which would have otherwise perished by this Distemper.

Upon the whole it is submitted to the Judgment of every impartial and well-meaning

meaning Person, who will be at the trouble fairly and maturely to weigh the several Matters of Fact here laid down, and the Consequences drawn from them, whether the Practice of Inoculation ought to be rejected as dangerous and uncertain; or whether it doth not rather deserve Commendation and Encouragement, as salutary and greatly beneficial to Mankind.

F I N I S.

APPENDIX.

Some Account of the Success of the Practice of INOCULATION in Foreign Parts.

SEveral Persons having been very desirous to know what Progress the Practice of Inoculation made, and with what Success it was carried on in Countries beyond Sea, I have thought proper for their Satisfaction to publish the following short Abstract of several Accounts either formerly transmitted to Dr. Jurin, or received since. I am far from thinking them so complete as I could desire, for which reason I chose to publish what I had to say on this Head

by

by itself, and independently from the Account of the Success of this Practice in *Great Britain*. Neither will I as yet pretend to draw any Inferences from thence, but content myself with a bare Narrative of Matter of Fact, till by receiving ampler and more particular Informations, for which I shall be very thankful, I shall be better able to form some Estimate of its Hazard compared with that of the natural Small-Pox.

*A List of the Persons inoculated
in Foreign Parts.*

In New England.

At Boston and in the neighbouring Towns.

By Dr. Zabdiel Boylston in 1721 and 1722.

244

At Roxbury in Cambridge.

By Dr. Roby in the same Years

11

By Dr. Thompson at the same time.

25

In

In *Ireland.*

At *Dublin.*

By Mr. *Hannibal Hall*, Surgeon, in
1723, 1724, 1725, and 1726. 16

By Mr. *John Nicholls* 4

Five Children inoculated in *August*, 1725 5

N. B. The Case of these five Children was publish'd at *Dublin*, by *Bryan Robinson*, and although there is no mention made either of their Names, or the Person by whom they were inoculated, yet I chuse to insert two of them, lest I should be accused by the Opposers of Inoculation, of Partiality, in concealing any Thing that tends to the Disadvantage of this Practice, two out of these five being suspected to have died of Inoculation.

F

The

The CASES of the nine Persons suspected to have died of Inoculation, in the Words of those Gentlemen, that either inoculated them, or attended them in their Illness.

“ I. **M**R S. *Dixwell*, aged thirty six,
 “ was inoculated at *Boston*
 “ in *New England*, *August 30. 1721.*
 “ She was a fat Gentlewoman, of a
 “ tender Constitution; she came fright-
 “ ned into the Practice, as most of
 “ the others had done, not only by
 “ living near the infected, but passing
 “ some Days before by a Door wherein
 “ lay a Corpse ready for the Grave,
 “ which died of the confluent Small-
 “ Pox, the Stench whereof greatly of-
 “ fended

" fended and surprized her with Fear
 " of being infected. However, she went
 " the usual time of nine Days before
 " the Eruption, and broke out full of
 " a distinct sort, but being of a very
 " moist Habit, they fluxed in her Face
 " about the seventh Day. She had a
 " sore Throat, was often restless, and
 " by turns had a difficulty of breath-
 " ing, her Fever and Thirst being yet
 " moderate. The eleventh her Pox
 " began to turn, her Face became
 " crusty, and the fourteenth her Scabs
 " began to fall off, and she appeared
 " more comfortable; her Incisions grew
 " wider and run plentifully. All this
 " while we were in good hopes of her
 " doing well. This Afternoon her
 " two Children were brought to her
 " just recovered in the natural Way,
 " which gave her great Joy, but put
 " her Spirits into too great a Motion,
 " and the Weather changing cool (I
 " apprehend) she took some cold, for
 " that Evening she was taken with
 " Hysterick Fits, which held her a-
 " bout two Hours; but upon the Use
 " of an Anodine, and some Anti-hyste-
 " rics, she became quiet, rested some

“ Hours that Night, and seem'd re-
 “ freshed in the Morning, and held it
 “ good Part of the Day; but the E-
 “ vening returning brought on her Fits;
 “ together with a new Fever, upon
 “ which I bled her, and repeated her
 “ Blisters, and used many other Means,
 “ but to no effect. The Fits and Fever
 “ followed her Close until the seven-
 “ teenth from Eruption, and twenty
 “ sixth from Inoculation, when she
 “ died.” *Dr. Zabdiel Boylston's Historical Account of the Small-Pox inoculated in New England.* London, 1726, 4^o,
 pag. 10.

“ II. “ *John White Esq;* aged fifty
 “ two, was inoculated *November 21,*
 “ 1721. He was then a weak infirm
 “ Man, and had been so near thirty
 “ Years, some time consumptive and
 “ very splenetic. Thus knowing his
 “ unhappy Constitution, I persuaded
 “ him to remove further into the Coun-
 “ try to avoid the Infection. He, tired
 “ with a Country-Life already, and
 “ not knowing when *Boston* would be
 “ freed from the Small-Pox, though
 “ very cautious and timorous, yet would
 “ be

" be inoculated. The Small-Pox came
 " out on the ninth, as usual, of the
 " distinct sort, the Symptoms easy.
 " They continued coming out the
 " tenth and eleventh, at which time
 " he was pretty full, of a very distinct
 " sort, and the Symptoms easy, except
 " that he was splenetick and dull, which
 " he was from the sixth, when he first
 " complained; the twelfth and thir-
 " teenth the Pock came forward, though
 " slowly, and of but an indifferent
 " Complexion. Now his splenetick
 " Darknesses increased, and whereas
 " the first Days he took but little
 " Nourishment, now he would take
 " none by his Good-will, and refused
 " to be spoke to, or comforted, not-
 " withstanding he had no Complaints,
 " either of Pain or Sickness, Heat or
 " Oppression at his Breast. Thus he
 " lay languishing and withering away
 " like a Plant without Moisture (the
 " Pock not ripe, and of a livid Co-
 " lour) until the twelfth of Eruption,
 " and twenty first from Inoculation,
 " when he died." Dr. Boylston, page
 23. of his *Historical Account*, &c.

III. " An

III. " An *Indian* Girl, about seven-
 " teen Years old, was inoculated at
 " *Boston*, November 29. 1721. She was
 " put into the same Room with eight
 " others inoculated at the same time.
 " She was taken ill the seventh with
 " a gentle Fever, which continued to
 " the ninth, when the Small-Pox came
 " out upon her, of a kind and distinct
 " sort, she having about twenty in her
 " Face, so that she was easy and laughed,
 " as I found her half naked, sitting up
 " in the Bed. The tenth I visited the
 " Family late in the Evening, and the
 " Nurse said the *Indian* was very dull,
 " and did not care to speak. I found
 " her very ill, the Pock sunk in, her
 " Pulse too frequent and uneven. I
 " ordered her out of her cold Room
 " near a Fire, and many Means were
 " used to get the Pock out again, but
 " to no purpose, for she died before
 " Morning. She was a weakly Girl,
 " subject to Humours breaking out up-
 " on her, Years before." *Dr. Boyl-*
 " *ston*, pag. 30. of his *Account*.

IV. " Mrs.

IV. " Mrs. *Bethiah Scarborough*, aged
 " twenty two, was inoculated with
 " twelve others, *December 1. 1721.*
 " She had her Illness begun the seventh
 " Day, with a gentle Fever, and so
 " continued to the ninth, when her
 " Fever encreased, and she complained
 " of her Head, Back, &c. as is usual,
 " and no more. No Pox yet appear-
 " ing, she had Blisters ordered her,
 " and other Means prescribed to bring
 " out the Pox, and that she should
 " be kept warm in Bed ; and so I
 " left her that Night. The next Night
 " I found her. (unexpectedly in her
 " Clothes) upon her Bed, faint and
 " weak, with a faltering, weak, and
 " dangerous Pulse ; and her Nurse told
 " me her Courses were upon her, and
 " that she could not keep her in Bed.
 " I did the best I could for her, (be-
 " ing late at Night, and no Shop at
 " hand) but to no effect ; she died be-
 " fore Morning. She had been sever-
 " al Years, as her Mother and others
 " told me, a very sickly young Wo-
 " man, and never well. In short,
 " through my great Hurry, she was but
 poorly

“ poorly doctor’d and badly nurs’d, and
 “ so she died, before the Pox came
 “ out.” *Dr. Boylston, page 31. of his*
Account, &c.

V. “ *Mr. Edmond Wells's Wife*, aged
 “ fifty four, was inoculated at *Roxbury*,
 “ *December 2. 1721.* She was a very
 “ weakly Gentlewoman, always com-
 “ plaining, and of a very ill Habit of
 “ Body, and so very splenetick, as often
 “ to be deprived of Reason, and for
 “ many Years not capable of managing
 “ her Family Affairs. She had the
 “ Small-Pox at the usual time, and
 “ of a very distinct sort, and the Symp-
 “ toms continued moderate for the first
 “ five Days, save that the cold Wea-
 “ ther pinched her very much. The
 “ sixth, seventh, and eighth Days she
 “ was more uneasy, slept but little,
 “ grew faint and weaker, the cold
 “ Weather affecting her still more, and
 “ the native Heat declining apace. The
 “ Pock not filling, she sunk under it,
 “ and died the ninth from Eruption,
 “ and the seventeenth from her Inci-
 “ sions.” *Dr. Boylston, page 33. of*
his Account, &c.

VI. “ *Mr.*

VI. " Mr. *Philip Serle's* Wife, aged
 " sixty three, was inoculated at the same
 " time with *Mrs. Wells*. She was like-
 " wise an ailing old Woman, hysterical,
 " splenetic, and of an ill Habit of Bo-
 " dy. She had the Small-Pox at the
 " usual time, and of a very distinct
 " sort; the Symptoms were moderate,
 " though she was often complaining
 " of one Uneasiness or other, as is
 " common in the Small-Pox; and the
 " cold Weather likewise affected her
 " very much. Thus she continued,
 " till the Pock fill'd and turn'd, and
 " the Scabs cast off; one Day a little
 " better, and another worse; sometimes
 " up, and other times in Bed. The
 " Perspiration being stopped by the
 " cold Weather, and a Complication of
 " Humours being put in Motion, it
 " at last fell upon her Bowels. She
 " had a purging three or four Days,
 " which carried her off. She died
 " the twenty fourth from Eruption,
 " and thirty third from Inoculation."
Dr. Boylston, pag. 33, 34. of his Ac-
count, &c.

VII. " *Pearcy Oliver*, aged fourteen
 " Months, was inoculated at *Dublin*
 " by Mr. *Hannibal Hall*, March 15.
 " 172 $\frac{1}{4}$. He was a very sickly and in-
 " firm Child from the Birth, had a
 " Weakness and Relaxation in all his
 " Joints, being very rickety, had not
 " a Tooth at fourteen Months; he
 " had no Use of his Limbs, the Mould
 " of his Head very much open, and
 " the Sutures at a considerable distance
 " from each other, insomuch that there
 " was a considerable Portion of the *Ce-*
 " *rebrum* contained within the *Pia* and
 " *Dura Mater*, to the Bigness of a
 " Walnut, which appeared in the open-
 " ing of the Mould elevated above and
 " without the Sutures. This Accident
 " was not known to the Physician,
 " nor to me, till some time after he
 " had been inoculated; he was a very
 " unfit Subject for the Operation: how-
 " ever, the Parents having lost several
 " Children in the Small-Pox in the na-
 " tural Way, and his Brother, tho' a
 " weak Child, having undergone the
 " Operation with good Success, en-
 " couraged the Parents to have this
 " Child

“ inoculated, which he underwent the
 “ Day abovementioned by making an
 “ Issue in his right Thigh, he having
 “ an Issue in his Left Arm made some
 “ Months before; the Pledgets moistned
 “ in the Matter were removed at the
 “ usual time, when I observed an In-
 “ flammation round the Issue, which
 “ encreased daily with a very fetid Sa-
 “ nies from the Issue, which was much
 “ enlarged by the Sharpness of the
 “ Humour, both in Depth and Breadth,
 “ with a foul Slough in the Bottom.
 “ The seventh Day the Fever began,
 “ and he became restless; the eighth
 “ the Fever grew higher, and in the E-
 “ vening the Small-Pox appeared in his
 “ Face and Arms; the ninth they came
 “ out in great Numbers on his Arms
 “ and Thighs, the Fever went off,
 “ the Issue in his Thigh runs plen-
 “ tifully, and the Matter of a better
 “ Consistence, the Slough in the Bot-
 “ tom separates, the Issue formerly
 “ made in his Arm runs very much;
 “ the tenth Day the Pustules fill and
 “ are very distinct, but of the smal-
 “ ler sort; the twelfth the Small-Pox
 “ dry on his Face; the thirteenth Day

“ he is seized with a Looseness, which
 “ by the Care of his Physician Dr.
 “ *Mitchell* was stopt; the fourteenth
 “ I observed a small Tumour in the
 “ Inside of the Thigh in which the
 “ Issue was made; the Tumour was
 “ nigh to the Groin, it increased with
 “ Inflammation, Anodines and Emol-
 “ lients were used, and in a few Days
 “ the Tumour tended to Suppuration,
 “ which was promoted by suppurative
 “ Cataplasms; when suppurated, I laid
 “ it open, and discharged a large Quanti-
 “ ty of well digested Matter, and in a few
 “ Days the Sore heal’d. He was several
 “ Times purged with Syrrup of Rhu-
 “ barb, and some Grains of the Pow-
 “ der; he was subject by Times to a
 “ Looseness; he continued well, but
 “ weak, for some considerable Time
 “ after the Small-Pox were over. Af-
 “ terwards he was seized with a Hea-
 “ viness or Weight in his Head and
 “ Neck, which he had been subject to;
 “ his Physician prescribed such Medi-
 “ cines as he thought proper in his
 “ Case; he was afterwards seiz’d with
 “ a Foaming at his Mouth, and a con-
 “ vulsive

"vulſive Fit which carried him off;
 "To which Fits he had formerly been
 "ſubject." *Thus far Mr. Hannibal*
Hall.

To this Account were ſubjoin'd the
 following Certificates.

"We do hereby certify, that *Pearcy*
 "*Oliver* was from his Birth to his
 "Death a very weak Child, and had a
 "Heavineſs in his Neck, ſo as his
 "Head lay back for the moſt Part;
 "unless when ſupported; he was fre-
 "quently ſubject to a Loofeneſs, with a
 "very great Weakneſs in all his Joints,
 "inſomuch that at the age of ſixteen
 "Months he could not ſet his Feet
 "to the Ground ſo as to bear the
 "Weight of his Body; he had not
 "one of his Teeth cut at his Death.
 "The more than uſual Weight and
 "Heavineſs of his Head ſeized him
 "the fifteenth Day of *April*, which
 "continued 'till the ſeventeenth Day
 "of the ſame Month, when he foam'd
 "at the Mouth, with a ſmall con-
 "vulſive Fit, of which he died, be-
 "ing

“ ing the thirty third Day from his
 “ being inoculated.

Dublin, February
 27th. 1723.

Tho. Tilson.
Eliz. Tilson.

“ I do hereby certify, that I at-
 “ tended *Pearcy Oliver* in the Station
 “ of a Dry-Nurse for several Months
 “ before he was inoculated, and after-
 “ wards 'till his Death, and during the
 “ whole Time of my waiting upon
 “ him, which was constant from my
 “ first coming to him, I found him
 “ to be a very weak and sickly Child,
 “ with a great Weight and Heaviness
 “ in his Head and Weakness in his
 “ Neck, insomuch that his Head lay
 “ always back betwixt his Shoulders
 “ unless supported; all his Joints were
 “ loose and weak, as not to be able to
 “ bear the Weight of his Body; he
 “ was a Child of no manner of Action
 “ as others of his Months; he had a
 “ voracious Stomach, though he did
 “ not thrive, or get Flesh by his Nou-
 “ rishment; he was often seized with a
 “ Looseness, but it did not continue a-
 “ bove

" bove a Day at one time; two Days
 " before his Death, the Heaviness or
 " Weight in his Head encreased more
 " than usual, as not to suffer his Head
 " to be kept up, and at last was seized
 " with a Foaming at his Mouth with
 " a convulsive Fit, which carried him
 " off.

Dublin, February
 27th. 1725.

Sara Warner.

VIII. " The eldest Son of a Gentle-
 " man at *Dublin*; aged thirteen Years,
 " was inoculated in *Dublin*, *August*
 " 26, 1725. He was nursed in the
 " Country, where he continued 'till he
 " was a Year and a half old, and was
 " then brought home to his Parents in
 " a very poor and weak Condition.
 " Soon after he grew ricketty, but re-
 " cover'd from that Disease in less than
 " a Year. In some Months after his
 " Recovery, he got a Swelling in his
 " Foot, which suppurated, broke, and
 " ran for several Weeks. After this
 " was heal'd, he continued well for
 " about three Years, then he had an
 " Abscess in his Belly below the Navel,
 " which

" which suppurated, broke and was
 " healed in about two Months. Since
 " that Time he enjoy'd a very good
 " State of Health, and was a strong
 " lusty Boy when he was inoculated.

" On the eighth Day after Inocula-
 " tion, he began to be disordered with
 " a Head-ach and Vomiting. His Vo-
 " miting was frequent and violent 'till
 " the third Day of his Illness, and then
 " it abated, but did not cease, for he
 " vomited at times 'till the fourth
 " Day at Noon. No Pock appeared,
 " but on the third at Night purple
 " Spots of different Sizes were observ'd
 " all over his Body, many of which
 " were as large in Diameter as a mid-
 " ling Pea. About this time he faint-
 " ed, and died in the Evening of the
 " fourth Day, about twenty four Hours
 " after the first Appearance of the Spots.
 " He was extremely thirsty during his
 " Illness, and for the most part pale
 " and cold.

" His Incision had a good Digesti-
 " on at the second Dressing, which was
 " on the third Day after it was made,
 " and

" and continued in this State 'till the
 " Day on which he sickened; then it
 " grew pale, flaccid, and had little or
 " no Discharge. It continued thus 'till
 " the third Day of his Sickneſs; then
 " it turned blackiſh, and was perfect-
 " ly dry on the fourth, the Day on
 " which he died.

IX. " The third Son of the ſame
 " Gentleman, aged about ten Years,
 " was inoculated at the ſame time with
 " his Brother. He was a freſh co-
 " lour'd, ſtrong, healthy Boy, who ne-
 " ver had any Sickneſs, began to be
 " diſorder'd on the eighth Day after In-
 " oculation; in the Evening he com-
 " plained of a Pain in his Head and
 " Belly. He was very hot, thirſty and
 " reſtleſs all that Night. The next
 " Day, which was the ſecond of his
 " Sickneſs, he vomited in the Morn-
 " ing, and continued vomiting at Times
 " 'till the third Day in the Evening.
 " Then the Eruption began, and on
 " the fourth in the Morning it appear'd
 " in his Face like an *Eryſipelas*. I
 " could not at that Time diſcover any
 " Puſtules either on his Body or Limbs,
 H " but

“ but he had many purple Spots all over
 “ him, especially in his Neck and
 “ Loins, many of which were as large
 “ in Diameter as a great Pin's Head.
 “ On the fifth the Pock began to ap-
 “ pear in his Body and Limbs, and
 “ came out thick on the sixth. He
 “ was extremely restless, and raved
 “ much from the beginning of the E-
 “ ruption to the sixth Day, but was
 “ pretty quiet that Night, slept, and
 “ began to spit. On the seventh his
 “ Face was swell'd, his Spitting conti-
 “ nued, and he had some Sleep. On
 “ the eighth he continued much in the
 “ same State, only drank and slept more
 “ than he had done before. On the
 “ ninth in the Morning the Swelling of
 “ his Face abated. On the eleventh his
 “ Breath grew short, his Spitting stopt,
 “ and he died in the Evening. His
 “ Pock was the worst Sort of the con-
 “ fluent Kind, it never fill'd nor digest-
 “ ed; but continued flat and watery 'till
 “ his Death. He had no Thirst, and
 “ would drink but little during his
 “ Illness.

“ His

" His Incision discharged a well di-
 " gested Matter from the third Day
 " after Inoculation 'till the Day on
 " which he sicken'd: Then it grew pale,
 " flaccid, and had little or no Discharge.
 " It continued thus to the eighth Day
 " of his Sickness, then it turn'd black
 " and was scarified: On the ninth it
 " discharged a little thin Sanies: It grew
 " quite dry on the tenth, the Day be-
 " fore he died."

A Paper relating to the Inoculation of the Small-Pox, as it is practised in the Kingdoms of Tripoli, Tunis, and Algier. Written in Arabick, by his Excellency Cassem Aga, Ambassador from Tripoli, and F. R. S. Done into English from the French of Mr. Dadichi, his Majesty's Interpreter for the Eastern Languages.

MY Opinion being asked relating to the Inoculation of the Small-Pox, I will mention in a few Words what I know of it. If any one hath a Mind to have his Children

dren inoculated, he carries them to one that lies ill of the Small-Pox, at the Time when the Pustules are come to full Maturity. Then the Surgeon makes an Incision upon the Back of the Hand, between the Thumb and Fore-finger, and puts a little of the Matter, squeez'd out of one of the largest and fullest Pustules, into the Wound. This done, the Child's Hand is wrapp'd up with a Handkerchief to keep it from the Air, and he is left to his Liberty 'till the Fever arising confines him to his Bed, which commonly happens at the End of three or four Days. After that, by God's Permission, a few Pustules of the Small-Pox break out upon the Child. All this I can confirm by a domestick Proof: For my Father carried us, five Brothers and three Sisters, to the House of a Girl that lay ill of the Small-Pox, and had us all inoculated the same Day. Now he that had most of us all, had not above twenty Pustules. Otherwise this Practice is so innocent, and so sure, that out of a hundred Persons inoculated not two die; whereas on the contrary, out of an hundred Persons, that are infected with the Small-Pox

Pox the natural Way, there die commonly about thirty. It is withal so antient in the Kingdoms of *Tripoli*, *Tunis* and *Algier*, that no body remembers its first rise: and it is generally practised not only by the Inhabitants of the Towns, but also by the wild *Arabs*.

(63)
For the natural Way there the com-
monly about thirty. It is wished
in the Kingdoms of Teyan
and Teyan, that no body remain-
here is left: and it is generally
practised not only by the Indians
of the Towns, but also by the wild
Indians.
